Holotype — male: S. Mongolia: East Gobi aimak, 19 km. S. of Sainschand, 1000 m., 27. VI. 1963 (loc. no. 43). Hungarian Nat. Hist. Museum, Zoological Department, Budapest.

According to kind communication of Dr. I. M. Kerzhner there are a furher four specimens ($\delta\delta$ and $\varphi\varphi$) of this species from Iche-bogdo

Phimodera kaszabi sp. n. is very close to *Phimodera bergi* Jakovlev, 1905, however it differs in some characters, antennae of the new species have the fourth antennal segment longest, pronotum in the new species being more flattened and the anterior margin being as broad as the width of head across eyes. *Phimodera bergi* Jakovlev is described from one female (holotype) from Balkhash Lake in Kazakhstan.
